

Is your patient using a 52mg LNG IUD* (e.g. Mirena) for HRT?

*52mg levonorgestrel-releasing intrauterine device

52mg LNG IUD must be changed within 5 years if used for HRT

What do I do if I find a patient with an expired 52mg LNG IUD and still on estrogen only HRT?

Any PV bleeding after changing 52mg LNG IUD or prescribing alternative progestogen should be referred to the menopause clinic for advice
